JOB MARKET PAPER	Parenthood Timing and Gender Inequality <i>Abstract:</i> I study how parenthood affects women’s labor market outcomes and gender inequality. I introduce a method to quantify the impacts that simultaneously addresses selective parenthood timing and parenthood-timing-dependent effects. The method leverages quasi-experimental variation in the success of assisted conception procedures throughout women’s entire treatment histories. Using administrative Dutch data, I find that parenthood persistently reduces women’s work hours and income by 9 to 24 percent, accounting for up to half of post-child gender inequality in these outcomes. I also disentangle and quantify how selective timing and timing-dependent effects bias conventional estimators, providing insight into the conflicting findings in the literature. My approach is applicable to other settings where individuals are quasi-experimentally assigned to one state but may enter others either through direct selection or by opting into quasi-experimental reassignment.
